

EarthCam VR Site Tour App Redesign

November 11, 2022

EarthCam has redesigned its VR Site Tour app to make it faster, simpler, and more intuitive to capture and communicate progress for owners and contractors.

VR Site Tour is specifically designed for quick, straightforward reality capture for small-to-medium job sites. Interactive images are captured using a standard 360-degree camera, combined with EarthCam's environmental sensor data, and automatically assembled into a virtual project tour. It quickly converts a day's worth of progress into easy-to-share, 360-degree photos syncing them directly to site plans, CAD drawings, or 3D BIM models. All images are geo-tagged to properly align with the site plan. Immersive imagery quickly evidences actual live progress, reducing the need for site visits, preventing rework, and saving time and money for stakeholders.
